About

Rotor 51A is part of a research program designed to obtain experimental reference information for the selection of fans for propulsion systems for short-haul aircraft using the externally blown flap as the powered lift system. The rotor 51A is made of 12 blades and was designed for a tip-speed of 243.8 meters per second, a design efficiency of 0.863 and a pressure ratio of 1.15. However, experimental values are lower than expected design values (design efficiency: 0.836, pressure ratio: 1.111). The lower than design total pressure ratio was attributed to the failure to obtain the design energy input into the rotor.

Reference blade

The **reference blade** is defined with multiple-circular arc profiles^[3] given in the original NASA report^[1]. Corresponding models are computed with the open-source code OpenMCAD^[2].

Geometry

The geometry of rotor 51A is described in the [original NASA report](#) by the following table. The lengths are in inches and the angles in degrees.

À propos

Le rotor 51A fait partie d'un programme de recherche visant à obtenir des résultats expérimentaux de référence pour la sélection de soufflantes pour les avions court-courrier utilisant des volets à soufflage externe. Le rotor 51A possède 12 pales et a été conçu pour une vitesse de pointe de 243,8 mètres par seconde, un rendement de 0,863 et un taux de compression de 1,151 à vitesse nominale. Toutefois, les caractéristiques expérimentales effectivement mesurées sont inférieures (rendement de 0,836 et taux de compression de 1,111), en raison de l'impossibilité d'obtenir un apport d'énergie suffisant en entrée du rotor.
