About

To reduce fan noise, an advanced, two-stage, high-pressure-ratio fan having widely spaced blade rows was build and tested. Rotor 67 is the rotor of the first stage of this fan. But, the overall efficiency of this two-stage fan was approximately 5 percentage points less than its design value. Analysis of the test results indicated that the first-stage stator and the second stage had potential for good performance but were hampered mainly by the dampered first-stage rotor. The dampers were responsible for large radial gradients of total pressure and deviation angle across a large portion of the blade height, resulting in mismatches in later blade rows. To improve performance of the first stage as well as the stage matching, the original two-stage fan was reconfigured with a newly designed first-stage rotor. Lower-aspect-ratio blading was selected for the rotor to eliminate both the need for part span dampers and their associated penalties on aerodynamic performance.

Useful documents

- [downloadable models](#) (Git project)
 - NASA technical report
(.pdf)
 - geometrical parameters file
(.csv), usable as input of OpenMCAD^[2] to generate reference blade models.

Reference blade

The **reference blade** is defined with multiple-circular arc profiles^[3] given in the original NASA report^[1]. Corresponding models are computed with the open-source code OpenMCAD^[2].

Geometry

The geometry of rotor 67 is described in the original NASA report by the following tables. The length are in centimeters and the angles in degrees.

TABLE III. - BLADE GEOMETRY

(a) First-stage rotor

| RP | PERCENT | | RADII | | BLADE ANGLES | | | DELTA | CONE |
|-----|---------|--------|--------|-------|--------------|--------|------|---------|------|

Aerodynamic design

| | unit | values |
|-----------------------------------|---------|--------|
| pressure ratio | [-] | 1.63 |
| mass flow | [kg/s] | 33.248 |
| tip speed | [m/s] | 427 |
| tip solidity | [-] | 1.288 |
| aspect ratio | [-] | 1.56 |
| number of blades | [-] | 22 |
| nominal rotation speed ω_n | [rad/s] | 1680 |

Material properties

The original material of the rotor 67 is not defined in the NASA report. A generic titanium Ti-6Al-4V is considered:

| | units | values |
|-----------------|----------------------|-----------|
| alloy | [-] | Ti-6Al-4V |
| Young's modulus | [GPa] | 108 |
| density | [kg/m ³] | 4400 |
| Poisson's ratio | [-] | 0.34 |
| yield stress | [GPa] | 0.824 |

CAD model

The CAD model is computed with the open source code OpenMCAD^[2].

pressure side

suction side

Natural frequencies

First three natural frequencies (with clamped root) for the mesh computed with OpenMCAD^[2]:

| Mode | Type | Natural angular frequency (rad/sec) | Natural frequency (Hz) |
|------|------|-------------------------------------|------------------------|
| 1 | 1B | 2318.54 | 369.01 |
| 2 | 2B | 6244.46 | 993.84 |
| 3 | 1T | 10871.29 | 1730.22 |

Campbell diagram

Evolution of the natural frequencies of the first 3 vibration modes, as a function of rotation speed, for the mesh computed with OpenMCAD^[2]:

Campbell diagram computed with a linear centrifugal preload, with clamped root (nominal rotation speed $\omega_n = 1\,680$ rad/s)

- graph (.pdf)
- Campbell data (.csv)

Initial blade

The **initial blade** is defined with in-house LAVA parameters^[4] computed from the reference blade CAD model. The initial blade is usually used as starting point for an optimization process. Its geometry is similar to the one of the reference blade.

Natural frequencies

First three natural frequencies (with clamped root)

- from the whole mesh:

| Mode | Type | Natural angular frequency (rad/sec) | Natural frequency (Hz) |
|------|------|-------------------------------------|------------------------|
| 1 | 1B | 2310.04 | 367.66 |
| 2 | 2B | 6215.77 | 989.27 |
| 3 | 1T | 10842.26 | 1725.60 |

- from the reduced order model:

| Mode | Type | Natural angular frequency (rad/sec) | Natural frequency (Hz) |
|------|------|-------------------------------------|------------------------|
| 1 | 1B | 2310.36 | 367.71 |
| 2 | 2B | 6222.56 | 990.35 |

| Mode | Type | Natural angular frequency (rad/sec) | Natural frequency (Hz) |
|------|------|-------------------------------------|------------------------|
| 3 | 1T | 10866.01 | 1729.38 |

Campbell diagram

Comparison of the evolution of the natural frequencies of the first 3 vibration modes, as a function of rotation speed for the initial and the reference blade:

Campbell diagram computed with a linear centrifugal preload, with clamped root (nominal speed $\omega_n = 1680$ rad/s),

initial blade (orange), reference blade (gray)

À propos

Pour réduire le bruit des soufflantes, une soufflante à deux étages a été construite et testée. Cette soufflante possède un grand taux de compression (2.4) et ses rangées d'aubes sont très espacées. Le

rotor 67 est le rotor du premier étage de cette soufflante. Cependant, le rendement global de cette soufflante à deux étages était inférieur d'environ 5% au rendement prévu. L'analyse des résultats des essais a montré que le stator du premier étage et le deuxième étage avaient un potentiel de bonnes performances, mais qu'ils étaient entravés principalement par le rotor du premier étage qui était amorti. Les amortisseurs étaient responsables d'importants gradients de pression totale et d'angle de déviation sur une grande partie de la hauteur des aubes, ce qui a entraîné des déséquilibres dans les rangées d'aubes ultérieures. Pour améliorer les performances du premier étage ainsi que l'appariement des étages, le rotor du premier étage a été reconfiguré. Des aubes à faible allongement d'aspect ont été privilégiées.
